

### Individual Journal Week 10/17/2021

The week of 10/11 – 10/15 I did my part in researching for the midterm project presentation. I was tasked with Front-End and UI UX. What I have found while researching front-end for the project is that I can use react-native to create a multiplatform that will be available for IOS & Android application. While it uses JavaScript's it can also allow others with knowledge of JS and follows on team to make changes to the application after our team is done. For UI UX design I have research what is the requirements of the applications, the constraints, and what tools or software I will use to create the UI UX designs to present to the sponsor. I asked to schedule a meeting with Professor Andy as I see that our team haven't even started on their assigned role research. This is to help get some information to assist my teams in starting their research and start on the slides. I helped edit the slides and presentation. Also, go over the speaker notes and edit to help make the speech better. I have created a google docs slide with questions for sponsor(screen shot below) to answers. Then forward an email to them. Some of the questions are more of a requirement to help gather more information about the projects. During the meeting with sponsor on Wednesday 20<sup>th</sup> I have also asked more questions about the project requirements to make sure what the sponsor are asking for is 100%. I lead the discussion on our weekly meeting trying to get the project started without any further delay. I have suggested we should start on the flow charts and get ready to start the prototype. The team finally began developing methods of tracking progress and designs for flow chart and prototype. I have decided that our meeting time keeps changing and that we are not 100% on track with the meeting. I have implemented a schedule bot for the group to keep reminder of meetings. Also, have completed merging an available time for the team to see who is available on that day. This way I suggested to clarify any time availability and it is easier for everyone to keep track of. We have agreed that the communication of Tabor and WSU teams will be through Discord. During the weekly meeting I suggested that we should make a schedule of availability. The problem is that no one is keeping track. Nor team lead is doing their jobs. For that meeting I have asked when are we starting on the project? This way we can get a head start and get ready for the final presentation. With only a month left doing the final presentation at the last minutes will be problematic. I also asked further ahead while worrying when will the team decide to start the project. We spent the time going over what we will do and how we will start.
