

Block Diagram Assignment

Note : There's a login service and a no login service.

Node1: Login Buttons will redirect to the database to retrieval of information and verify user information's.

Node2: No login buttons will default the user to the default menu that it was built.

Node3: When a user press one of the buttons functions from the menu it will direct them to a browser link. This will retrieve from the Tabor webserver and display it to the user.

Node4: Username is retrieved from the database (tabor)

Node5: Database information is now pre-load to the device and display accordingly to the layout on the screen.

Node6: There is two node6 because it will be the same. As 2 buttons will redirect and retrieves the information from tabor webserver and display it back to the users.

Node7: As the information retrieve it will load that information into the built-in browser or if we use web scraper it will build itself and display on the screen.

Node8: This button will do the same for non-login users and login users. If they press exit it will redirect them back to their perspective menu. For login will be back to them personalize login menu. For non-login it will go back to a default menu.
