

## **Personal Product Reflection & Individual Journal**

### **Goals**

- Meet with the sponsors to get the specifications needed for my project.
- Interview Dr. Stallard and get his feedback on my product idea.
- Begin the design phase of the project.
- Brainstorm what needs to get done for the product show case

### **Work notes**

- I have created a Github repository to host the source code, collaborate with team members, and write documentation. Since the ownership of the repository is under my account, I will need to transfer the ownership to Tabor College, my sponsor. I assisted them on how to set up a Github account and told them to stick with the free plan for now. Once we start getting into the development phase, we may consider upgrading to the team plan.
- Last week, I had a meeting with my sponsors to discuss the project specifications. They like the idea of having a login system. With this feature, the app can have three categories of people: guest, students, and administrators. They also want to leverage the system to enable push notifications. Guests will have a list of default notifications, students will have the options to subscribe to different notifications, and the administrator will have the permission to send out the notifications.
- Dr. Stallard is already informed about my product idea from multiple meetings that we had in the past. Thus, I wanted to hear his inputs on the project. He provided multiple valuable suggestions and drawbacks for me. Some examples are adopting swiping gestures to switch to different screens, utilizing Firebase services to enable push notifications, and talking to the IT people from Tabor college about their security measurement.
- Recently, I created the wireframe and wireflow of the app using Figma.
- I thought of different ideas that I could potentially use for the product show case. To make my presentation look approachable, my team and I could use a tri-fold poster board to present our progress so far.

### **What's next**

- Gather ideas from my team members and then create a presentational video for the product show case.
- Complete the mockup for the project app design.
- Have a meeting with my sponsors once the mockup is done and then hear their feedback.
